

Sentientia LMS Sample SOP

This document is a synthetic Standard Operating Procedure used as a fixture for the SENTIENTIA Content Pipeline. It exercises every block kind Agent 1 must recognise: titles, headings at two levels, paragraphs, ordered lists, and unordered lists.

Overview

The SENTIENTIA pipeline turns a written SOP into a SCORM training package. Agent 1 is the entry stage and converts the PDF into structured JSON the downstream agents can read.

Pipeline Stages

1. Parse the PDF into structured JSON.
2. Generate a narration script from the JSON.
3. Synthesise slides and voice from the narration.
4. Package the result into a SCORM 1.2 ZIP for upload.

Guarantees

- Pure local execution; no external API in the parser.
- Word count capped at two thousand words per SOP.
- Fails loudly when the cap is exceeded.
- Deterministic schema for the downstream contract.

Acceptance

A successful Agent 1 run emits a JSON file whose schema matches the contract published in the agent documentation. Agent 2 reads that file with no further transformation.
